Set Apart
FOOD-LABEL GUIDANCE · TESTING ALPHA

Ingredient guidance. Without false certainty.

A food-label companion for people seeking to follow Scripture's dietary instructions.

What you can try today

Type or paste a full ingredient statement. Review the result, the reasons and anything the app cannot establish. Keep a local history, or turn off new history in Settings.

Four results. No hidden guesswork.

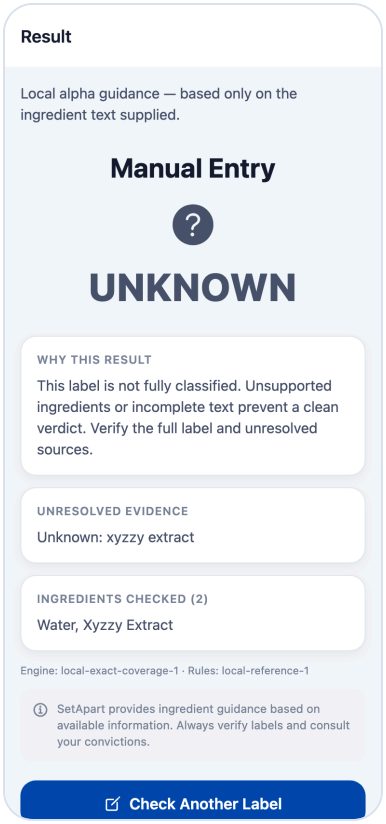

CLEAN Supplied text fits the current narrow reference list. Not product certification.

NOT CLEAN A current rule flags an ingredient, or Strict Mode applies an avoidance preference. Read the reason.

DISCERN A recognized ingredient needs source clarification.

UNKNOWN Evidence or ingredient coverage is insufficient. Never treat this as clean.

> **Help us improve the next build.**
> Try a real label and tell your inviter what was useful, unclear or wrong. Include the input, result and a screenshot.

Actual alpha screen. "xyzzy extract" is synthetic test text, not a product.

Works now

Manual ingredient entry, explained results, explicit unknowns, local history and history opt-out.

Not live yet

Real barcode lookup, photo OCR, accounts, cloud sync and subscriptions. Scanner flows use demo data.

Coverage is deliberately limited. Verify the physical label and ask the manufacturer when a source is unclear. Human judgment remains essential.
